What is claimed is:

5

25

WO 2005/058618

- 1. A power feeding arrangement for electric loads (R) mounted in tires (20) of vehicles, which arrangement comprises
  - at least one feed coil (L<sub>f</sub>) arranged in the vehicle (10),
  - at least one receiver coil (L<sub>1</sub> L<sub>4</sub>) arranged in the tire (20), and
  - at least one load (R) electrically coupled to the receiver coil (L<sub>1</sub> L<sub>4</sub>) via voltage
     rectifier(s) (31 -34)

## characterized in that in the arrangement

- each receiver coil (L<sub>1</sub> L<sub>4</sub>) is tuned with a serial capacitor (C<sub>1</sub>-C<sub>4</sub>) and connected to a voltage rectifier (31-34) whereby the DC output currents produced by each rectifier (31-34) flow to the load (R) via at least one receiver coil (L<sub>1</sub> L<sub>4</sub>).
- 2. The arrangement of claim 1, characterized in that the DC outputs of the voltage rectifiers
  (31-34) are coupled to the load resistor (R) via receiver coils (L<sub>1</sub> L<sub>4</sub>).
  - 3. The arrangement of claim 1, characterized in that the load (R) is an electronic circuit.
- 4. The arrangement of claim 1, characterized in that the number of receiver coils (L<sub>1</sub> L<sub>4</sub>) is
  20 four in each tire.
  - 5. A tire (20) comprising receiver coils according to any previous claim, **characterized** in that the surfaces of adjacent receiver coils  $(L_1 L_4)$  overlap so that the received power is essentially independent of the rotation angle of the tire.
  - 6. A power feeding method for electric loads (R) mounted in tires (20) of vehicles, in which method
    - at least one feed coil (L<sub>f</sub>) arranged in the vehicle (10) is used for feeding electrical power,

WO 2005/058618 PCT/FI2004/000777

- at least one receiver coil (L<sub>1</sub> L<sub>4</sub>) positioned in the tire (20) is used for receiving the fed power, and
- at least one load (R) electrically coupled to the receiver coil (L<sub>1</sub> L<sub>4</sub>) via voltage rectifier(s) (31 34),

## 5 **characterized** in that

15

20

- each receiver coil (L<sub>1</sub> L<sub>4</sub>) is tuned with a serial capacitor (C<sub>1</sub>-C<sub>4</sub>) and connected to a voltage rectifier (31 -34) whereby the DC output currents produced by each rectifier (31 34) flow to the load (R) via at least one receiver coil (L<sub>1</sub> L<sub>4</sub>).
- 7. The method of claim 6, **characterized** in that the DC outputs of the voltage rectifiers (31 34) are coupled to the load resistor (R) via receiver coils.
  - 8. The method of claim 6, characterized in that the number of receiver coils ( $L_1$ - $L_4$ ) is four in each tire.
  - 9. The method of claim 6, characterized in that the load (R) is an electronic circuit.
  - 10. A tire (20) for a vehicle (10), **characterized** in that the tire (20) comprises at least one serially tuned receiver coil  $(L_1 L_4)$  for receiving electrical power.
  - 11. A tire according to claim 10, **characterized** in that the number of receiver coils  $(L_1 L_4)$  is 4 or more.
- 12. A tire according to any previous claim, **characterized** in that the tire (20) comprises two sets of voltage rectifiers (30).
  - 13. A tire (20) comprising receiver coils according to any previous claim, **characterized** in that the surfaces of adjacent receiver coils  $(L_1 L_4)$  overlap so that the received power is essentially independent of the rotation angle of the tire.
